

# Milestone 1

## Project Subject

The purpose of this project is to prep, clean, and merge data from different sources including CSV, HTML, and an API.

## Data Sources

### 1. CSV/Excel/PDF

- [Professional Hockey Database](#)
  - saved "master.csv" locally
- This .csv file contains the names and biographical information of players from the NHL including:
  - name
  - nicknames
  - height
  - weight
  - Left/Right handed
  - Birth and Death Years
  - Birth Day and Month
  - Birthplace including the city and state

### 1. HTML

- [List of NHL Statistical Leaders](#)
- This HTML source includes two tables depicting All-time leaders (skaters)
- The first table is labeled regular season points. It includes:
  - name
  - teams
  - games played
  - Points
  - points per game
- The second table is labeled regular season goals. It includes:
  - name
  - teams
  - games played
  - goals
  - goals per game

### 1. API

- [NHL Records](#)
- This API discovered data by working through a JavaScript file from records.nhl.com. It includes information regarding the following categories:
  - attendance
  - draft
  - records
  - franchise
  - player
  - playoffs
  - trophy
  - milestones
  - officials

## Relationships

CSV File: Contains stats regarding NHL players listed by first name, last name, and nicknames.

Website: Contains stats regarding NHL players that are all time leaders (skaters), listed by name.

API: Contains stats regarding NHL players.

All 3 of these data sources are related by NHL player names. The player names are stored differently in each data type, but can be easily manipulated to create one to many relationships between the sources.

```
In [1]: # NOTE: I am rusty on API's and will need more time to explore the data
```

## Next Steps

The most important part of the project is going to be staying organized and making clear notes throughout the process. I am hopeful that the data cleanup in milestone two closely reflects data cleanup on both HTML and API formats. Anytime data is transformed, being able to communicate those changes is vital.

The data in my project includes many details regarding NHL athletes including demographics and player statistics. The ethical implications involve looking into individualized data rather than whole group anonymous data. Any insight that is unveiled directly involves a specific person and the intent in which that information is shared is critical.

Sports analysis has been around for many years. It has been used for recruiting, entertainment, trading purposes, training, etc. This project revolves more around data preparation. The goal is to be able to view data in different formats and restructure it so that it is easier to read and use. After the data is cleaned and merged, I look forward to looking into how many objects I was able to combine and what patterns come into view when looking at players from creative viewpoints.

Challenges in this project are going to come with new territory and a learning curve that comes with that. This will be the first time I have worked with HTML data. It will also be the first time merging different data sources together. Another challenge is simply the vast amount of data. With so many columns and rows, missing data is inevitable. I will need to figure out the best way to approach the Null values before visualizing or drawing conclusions in milestone 5.

## Milestone 2: Cleaning Flat File Source

```
In [2]: # Import Libraries for working with a dataframe, manipulating numerical data, and visualization
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
```

```
In [3]: # Load flat file and read the first few rows
master_df = pd.read_csv("Master.csv")
master_df.head(3)
```

```
Out[3]:

```
In [4]: # Print columns for easier reference
master_df.columns
```

```
Out[4]:
```

```
Index(['playerID', 'coachID', 'hofID', 'firstName', 'lastName', 'nameNote',
      'nameGiven', 'nameNick', 'height', 'weight', 'shootCatch', 'legendsID',
      'ihdbID', 'hrefID', 'firstNHL', 'lastNHL', 'firstWHA', 'lastWHA', 'pos',
      'birthYear', 'birthMon', 'birthDay', 'birthCountry', 'birthState',
      'birthCity', 'deathYear', 'deathMon', 'deathDay', 'deathCountry',
      'deathState', 'deathCity'],
      dtype='object')
```

## Data Cleaning: Step 1

We do not need all of the death information. I am going to leave the death Year, but delete 'deathMon', 'deathDay', 'deathCountry', 'deathState', 'deathCity'.

```
In [5]: #drop death related columns (other than the year)
master_df = master_df.drop(columns=['deathMon', 'deathDay', 'deathCountry', 'deathState', 'deathCity'])

#confirm that the columns are gone
master_df.columns
```

```
Out[5]: Index(['playerID', 'coachID', 'hofID', 'firstName', 'lastName', 'nameNote',
        'nameGiven', 'nameNick', 'height', 'weight', 'shootCatch', 'legendsID',

        'birthYear', 'birthMon', 'birthDay', 'birthCountry', 'birthState',
        'birthCity', 'deathYear'],
        dtype='object')
```

## Data Cleaning: Step 2

All names should be converted into lowercase for easier merging of data.

```
In [6]: # Lowercase columns, and check first 3 rows to check that changes were applied
master_df['firstName'] = master_df['firstName'].str.lower()
master_df['lastName'] = master_df['lastName'].str.lower()
master_df.head(3)
```

```

## Data Cleaning: Step 3

## Data Cleaning: Step 4

ihdbID is a column that I was unfamiliar with and needed to research. I will change the name of the column to an more natural title.

```
In [11]: master_df.rename(columns = {'ihdbID':'internetHockeyID'}, inplace = True)
master_df.columns

Out[11]: Index(['playerID', 'coachID', 'hofID', 'firstName', 'lastName', 'nameNote',

              'birthState', 'birthCity', 'deathYear'],
              dtype='object')
```

## Data Cleaning: Step 5

Next, I will look for and remove outliers.

```
In [12]: # Use the describe function to quickly scan the data
master_df.describe()
```

There are two interesting finds in the data above.

1. The data is only reporting players up until 2011.
2. There is an obvious outlier in the deathYear as the max value is year 9999.

93 rows × 26 columns

This is showing that there are 93 observations with death dates set in the year 9999. I was planning on deleting a single outlier, but it is clear this date was used as a "missing data" placeholder to some extent. Rather than deleting 93 rows, I will set the death dates of 9999 to a NaN value instead.

In [15]: `# replace death year of 9999 with NaN values`  
`master_df['deathYear'] = master_df['deathYear'].replace({9999: np.nan})`

There is still some discrepancy with death year, but the boxplot looks much better. Notice the earliest recorded death date is 1907, but the earliest WHA or NHL is in 1917. At this point, I will proceed with caution. If the early outliers impact results, they can still be removed.

dtype: object
```

## Data Cleaning: Step 1

GP and PPG were not quickly recognizeable for a non-hockey fan. I will change the name of the column to an more natural title. Also, having parenthesis in a title makes it hard to work with. I will change the name of the column Team(s) as well.

In [26]:

```
# Rename column headers and confirm that changes were applied correctly
html_df.rename(columns = {'GP':'gamesPlayed'}, inplace = True)
html_df.rename(columns = {'PPG':'ptsperGame'}, inplace = True)
html_df.rename(columns = {'Team(s)':'Teams'}, inplace = True)
html_df.head(3)
```

2	3	Mark Messier	EDM, NYR, VAN	1756	1887	1.07

## Data Cleaning: Step 2

All names should be converted into lowercase for easier merging of data.

In [27]:

```
# lowercase columns, and check first 3 rows to check that changes were applied
html_df['Name'] = html_df['Name'].str.lower()
html_df.head(3)
```

Out[27]:

	Rank	Name	Teams	gamesPlayed	Pts	ptsperGame
0	1	wayne gretzky	EDM, LAK, STL, NYR	1487	2857	1.92
1	2	jaromir jagr	PIT, WSH, NYR, PHI, DAL, BOS, NJD, FLA, CGY	1733	1921	1.11
2	3	mark messier	EDM, NYR, VAN	1756	1887	1.07

## Data Cleaning: Step 3

The master dataframe has two columns for names called firstName and lastName. I will split the Name column into two columns to match the master dataframe.

In [28]:

```
# Split the names into firstName and LastName to match the master dataframe
# Confirm the columns were added
html_df[['firstName', 'lastName']] = html_df.Name.str.split(expand=True)
html_df.head(3)
```

Out[28]:

	Rank	Name	Teams	gamesPlayed	Pts	ptsperGame	firstName	lastName
0	1	wayne gretzky	EDM, LAK, STL, NYR	1487	2857	1.92	wayne	gretzky
1	2	jaromir jagr	PIT, WSH, NYR, PHI, DAL, BOS, NJD, FLA, CGY	1733	1921	1.11	jaromir	jagr
2	3	mark messier	EDM, NYR, VAN	1756	1887	1.07	mark	messier

## Data Cleaning: Step 4

The master dataframe does not include a full name column. I will drop the name column.

```
In [29]: # drop the name column and confirm the column was dropped
html_df = html_df.drop(columns=['Name'])
html_df.head(3)
```

```
Out[29]:
```

	Rank	Teams	gamesPlayed	Pts	ptsperGame	firstName	lastName
0	1	EDM, LAK, STL, NYR	1487	2857	1.92	wayne	gretzky
1	2	PIT, WSH, NYR, PHI, DAL, BOS, NJD, FLA, CGY	1733	1921	1.11	jaromir	jagr
2	3	EDM, NYR, VAN	1756	1887	1.07	mark	messier

## Data Cleaning: Step 5

I would like to do something about having multiple names under teams. I will start by converting the object to a string. It would be nice to add a column stating how many teams they played for, but I have not yet figured out how to do this.

```
In [30]: # change the Teams Column into a string
html_df["Teams"] = html_df["Teams"].astype(str)
html_df.head(3)
```

```
Out[30]:
```

	Rank	Teams	gamesPlayed	Pts	ptsperGame	firstName	lastName
0	1	EDM, LAK, STL, NYR	1487	2857	1.92	wayne	gretzky
1	2	PIT, WSH, NYR, PHI, DAL, BOS, NJD, FLA, CGY	1733	1921	1.11	jaromir	jagr
2	3	EDM, NYR, VAN	1756	1887	1.07	mark	messier

## Ethical Implications

The cleaning of this particular html data set has minor implications. When working on data that includes real people, it is important to keep data honest. In this data set, there were no missing values that needed to be replaced with mean or median values. All player names were simply split and lowercased, but in no other way changed. I think the largest ethical impact is that this data source came from wikipedia, which can be publicly edited and therefore not accurate in the first place.

## Milestone 4: Connecting to an API/Pulling in the Data and Cleaning/Formatting

```
In [31]: # Load Libraries needed for working with API data
import urllib.request, urllib.parse, urllib.error
import json
import requests
```

```
In [32]: serviceurl = "https://records.nhl.com/site/api"
recordslookup = "/milestone-1000-point-career"
```

```
In [33]: url = serviceurl + recordslookup
url = requests.get("https://records.nhl.com/site/api/milestone-1000-point-career")
```

```
In [34]: print(url.status_code)

200
```

```
In [35]: player_dict = url.json()
player_dict['data']
```

```

Drop unnecessary columns.

## Data Cleaning: Step 4

Rename a column for clarity

```

```

```

```

## Data Cleaning: Step 5

```
In [45]: player_df = player_df.assign(averagePPG = player_df.careerPoints / player_df.skaterCareerGamesPlayed)
player_df.head(3)
```

## Ethical Implications

On this data set, there was a lot of information that was deleted. Sometimes looking at data with less context can lead to interpretation errors. Since we are again dealing with real people, we need to make sure to keep the data honest and accurate. All names were lowercased, which should have no ethical impacts. There was a column added that human error could impact if not calculated correctly. This would result in producing false data.

## Milestone 5: Merging the Data and Storing in a Database/Visualizing Data

## Visualizations

### 1. Scatterplot comparing heights and weights

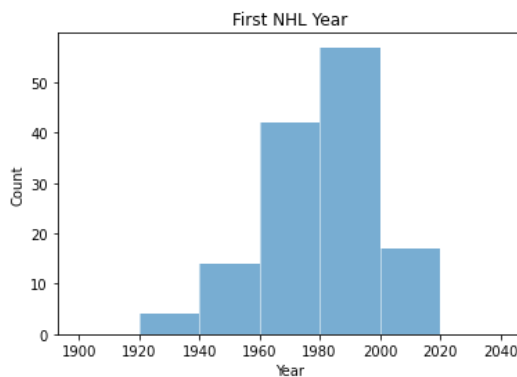

```
In [57]: # Compare height against weight in a scatterplot
merged_dfs.plot.scatter('height', 'weight', title= "height vs weight")
plt.show()
```

## 2. Histogram describing players' first NHL year

```
In [58]: # Fill null values in first NHL year with the average year
merged_dfs['firstNHL'].fillna(int(merged_dfs['firstNHL'].mean()), inplace=True)
```

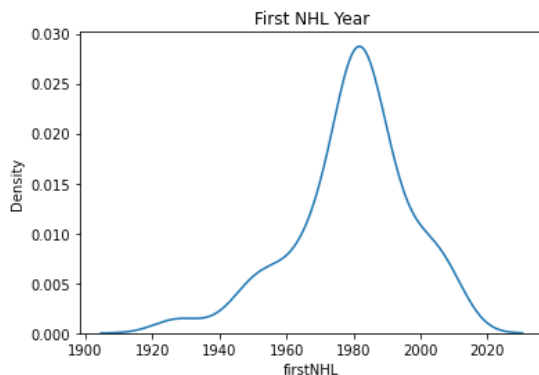

```
In [59]: # Create a histogram with set bin widths adding x Labels, y Labels, and a title
plt.hist(merged_dfs['firstNHL'], bins=[1900, 1920, 1940, 1960, 1980, 2000, 2020, 2040], label='First NHL Year', alpha=.6)
plt.xlabel('Year')
plt.ylabel('Count')
plt.title('First NHL Year')
plt.grid(color='white', lw = 0.5, axis='x')
plt.show()
```

## 3. Denistiy Plot describing the probability of a player starting in the NHL during different years (based on the players in our merged records dataframe)

```
In [60]: # Load seaborn Library for visualizations
import seaborn as sns
```

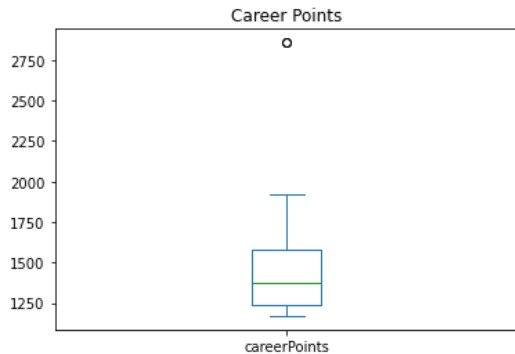

```
In [61]: # Create a density plot that shows the probability of a player starting the NHL during different years
sns.kdeplot(merged_dfs['firstNHL'])
plt.title('First NHL Year')
plt.show()
```

## 4. Boxplot of Career Points

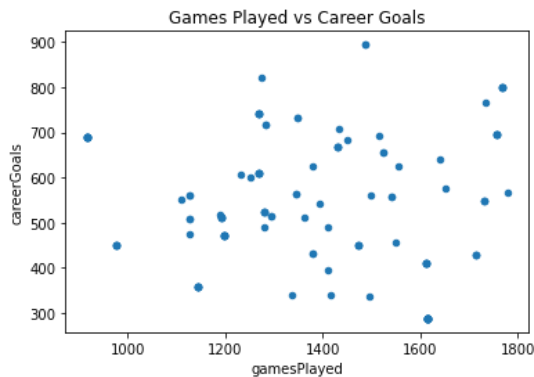

```
In [62]: # also check visually that the outliers no longer exist
merged_dfs['careerPoints'].plot(kind='box')
plt.title('Career Points')
```

```
Out[62]: Text(0.5, 1.0, 'Career Points')
```

## 5. Scatterplot comparing games played and career goals

```
In [63]: # Compare height against weight in a scatterplot
merged_dfs.plot.scatter('gamesPlayed', 'careerGoals', title= "Games Played vs Career Goals")
plt.show()
```

## Summary

For this project I was able to handle data from different sources including flat files, HTML, and APIs that housed data describing NHL players and records. I found it challenging to find data that was large enough to be able to merge at the end. For example, my original flat file began with 7,761 rows. When merging was complete, the final dataframe decreased to a total of 134 rows.

I was introduced to many new tasks through this project that I found extremely helpful in the successive DSC 550 course. Some of the key skills include:

- Opening and transforming data into a pandas data frame
- Detecting and replacing outliers
- Renaming columns
- Removing unnecessary data
- Reformatting data types
- Basic visualization techniques
- Introduction to SQL

This was also the first time that we were introduced to extracting data from HTML sources. I will need to continue to practice with HTML and API sources. However, I have grown tremendously in my ability to work with flat files and pandas dataframes.

As an emerging data scientist, I will need to continue to be careful with the results of my work. Cleansing data can introduce additional human errors into a project. This project was based on real athletes' statistics along with other personal information. It is immensely important that I am cautious when manipulating data so that facts and figures are not skewed. Visualizations should represent the data in a manner that will not get misinterpreted by my viewers/clients. Also, I should have spent more time at the beginning ensuring that my data was being pulled from legitimate sources. I believe that the data frame and results produced at the end of this project represent honest and accurate information.
